Introduction

- Axial piston motors with swash plate design can be applied to hydrostatic drives.
- Pressure up to 350 bar.
 Rated speed up to 1800 min⁻¹.
- A range of control options allow matching of motors to any application.
- Rotating and pressure loaded parts are pressure balanced.
- High efficiency from automatic pressure balancing of cylinder block to valve plate.
- Oversized shaft bearings for long life and thru-drive capability.
- Highly resistant to dirt because of automatic wear compensation.
- Low sound level assured by swash plate design and other proven features.

AVAILABLE DISPLACEMENT SIZES

250 ccm	
360 ccm	
500 ccm	
750 ccm	

Displacement controls:

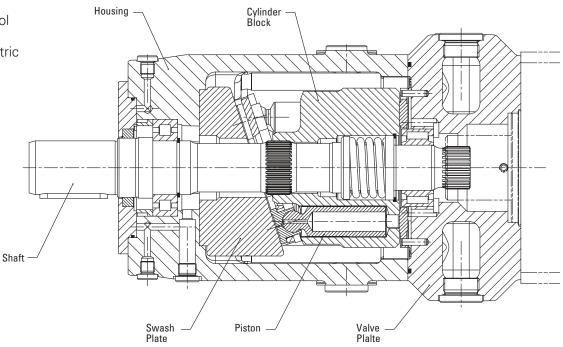

DF - Pressure compensator controlled

ES - Electric motor displacement control

SP - Displacement proportional to electric signal

DP - Displacement proportional to pressure signal

Typical Section of Transmission Pump

Motors

"W" Series

Form Page

The following 42-digit coding system has been developed to identify all of the configuration options for the "W" series fixed and variable displacement motors. Use this model code to specify a unit with the desired features. All 42-digits must be present when ordering. You may want to photocopy the matrix below to ensure that each number is entered in the correct box. If adjustments other than the standard setting (character 34...37) or special features (character 38...40) are needed, please provide the information when ordering.

Some characters are already filled out. For such characters there is no option available.

Explanation for each character can be found as follows:

¹⁾ Minimum speed for continuous operation

²⁾ Higher speed available on request

³⁾ Tolerance + 1%

Controls -Pressure Compensator, DF

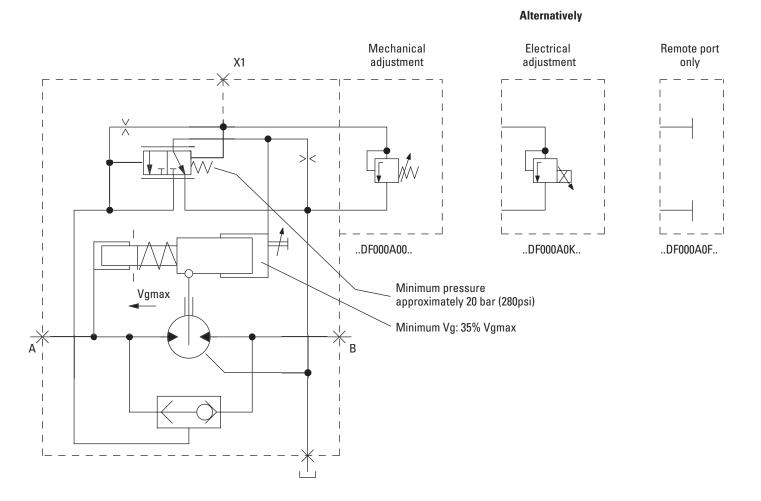

"W" Series - Motors

The motor will remain to the minimum volume flow rate (maximum speed, minimum torque) until the adjusted value of pressure is reached. Then the pump will change maximum volume flow rate (minimum speed and maximum torque).

Adjustment can be set either manually, hydraulically or electronically.

The standard Hydrokraft pressure compensator is pilot operated and very stable.

The maximum swashplate angle of the motor can be limited mechanically to between 50 and 100% by a screw.

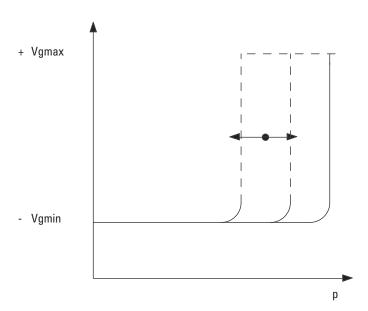

Controls -Pressure Compensator, DF (cont.)

"W" Series - Motors

As an additional option the maximum (or minimum) flow can also be limited by a spacer inside the control cylinder (position number 13 in model coding, options 4, 5 or 6 in combination with customer adjustment specification position 30-37 for the set values). This solution is also recom-

mended for very rough operating conditions and the need for exact repeatability over a long time period. The setting must be defined before ordering and cannot be modified during operation.

Controls -Electric Motor Displacement, ES

"W" Series - Motors

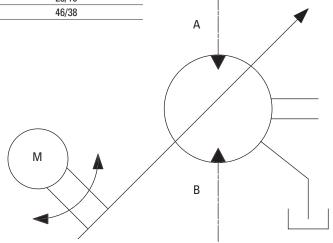

This ES-control adjusts the swash plate angle of the pump by means of a three phase electric servo motor, worm gearing and a switch box with 4 or (optional) 8 limit switches for different positions. A potentiometer for stepless adjustment and/or position monitoring is also available.

The response times from zero to maximum depends on the chosen ratio and the (fixed) speed of the servo motor (this means that once the control is

THEORETICAL RESPONSE TIME (SEC) FOR MAXIMUM DISPLACEMENT

SIZE	250	360	500	750	
Frequency Hz	50/60	50/60	50/60	50/60	
Fast	6/5	7/6	7/6	9/8	
Medium	13/11	18/15	16/13	23/19	
Slow	26/22	36/30	31/26	46/38	

Response time from Vgmin (35%) to +Vgmax (100%)

Controls -Pressure Signal Adjustment Displacement, DP

"W" Series - Motors

The swivel angle of the motor is proportional to the pilot pressure.

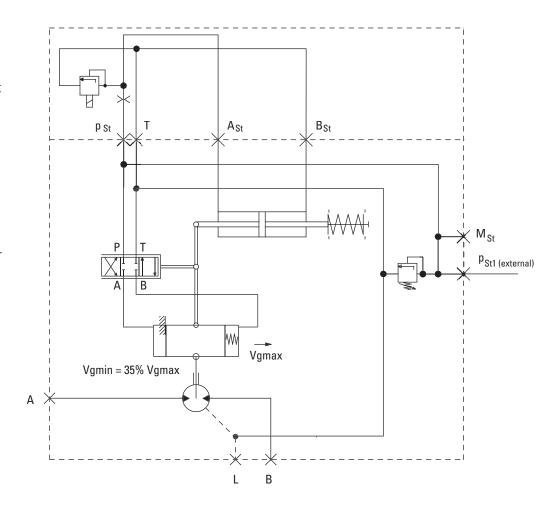

A separate pilot oil circuit is necessary. This circuit should be external to prevent the influence of variable motor speed to the pilot oil flow i.e., response time.

From this, the control pressure is reduced to the desired set value by means of a suitable pressure control valve (with P-T line) and throttle in P line 0.8 Ø (0.03 in).

The DP-control can be used for stepless adjustment of the swashplate angle with standard requirements in dynamic and precision.

No feedback signal is needed, an optical indicator is recommended (position 21 in model coding, option "V").

The output flow of the pump is proportional to the pilot pressure.

RESP	ONS	E TIM	IE (SEC)
WITH	12 L	/MIN	PII	LOT

PILOT PRESSURE

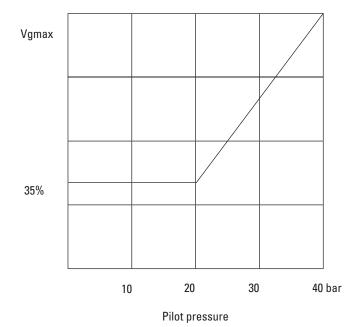

SIZE	OIL FLOW Vgmin - Vgmax	pst (bar)
250/360	0,8	60
500/750	1,8	80

Controls -Pressure Signal Adjustment Displacement, DP (cont.)

"W" Series - Motors

The maximum swash-plate angle of the motor can be limited mechanically to between 50% and 100% by screw. As an additional option the maximum (and/or minimum) value can be limited by a spacer inside the control cylinder (position number 13 in model coding, options 4, 5 or 6 in combination with customer adjustment specifi-

cation position 34-37 for the set values). This solution is also recommended for very rough operating conditions and the need for exact repeatability over a long time period. The setting must be defined before ordering and cannot be modified during operation.

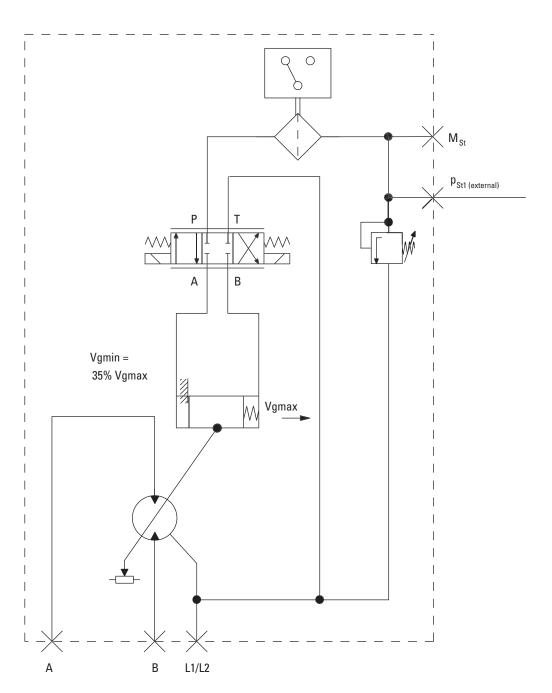

Controls -Electro Hydraulic Displacement Control, SP

"W" Series - Motors

The electrohydraulic displacement control works without throttle losses within electrically adjustable limits. This is done by controlling swash plate angle with electrical feedback (electrical closed-loop control). A separate pilot oil circuit is necessary. This circuit should be external to prevent the influence of variable motor speed to the pilot oil flow, i.e. response time.

The swashplate angle is recorded as an electrical signal and lead back to the control card. The proportional valve and servo piston transform the output signal of the control card to the desired setting. This results in a very precise and dynamic control.

Hysteresis, consistency: approximately 1% of end value.

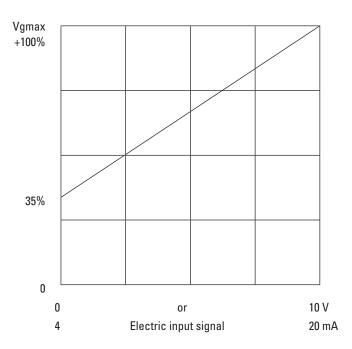

Controls -Electro Hydraulic Displacement Control, SP (cont.)

"W" Series - Motors

The maximum swash-plate angle of the motor can be limited mechanically to between 50% and 100% by a screw. As an additional option the maximum (and/or minimum) flow can be limited by a spacer inside the control cylinder (position number 14 in model coding, options 4, 5 or 6 in combination with

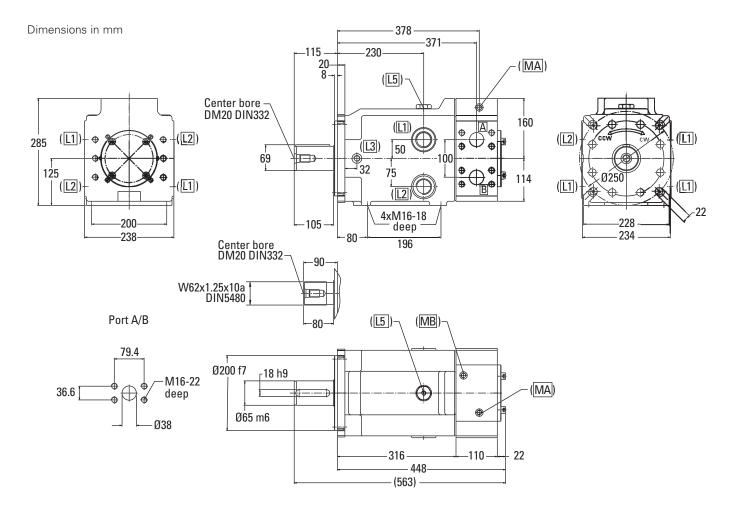

customer adjustment specification position 40-43 for the set values). This solution is also recommended for very rough operating conditions and the need for exact repeatability over a long time period. The setting must be defined before ordering and cannot be modified during operation.

INSTALLATION POSITION

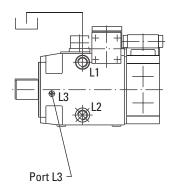

DRAIN PIPING

INSTALLATION POSITION

DRAIN PIPING

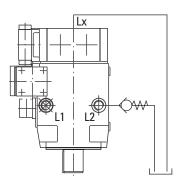

Shaft Horizontal

Highest drain port is to be used. Drain line must be arranged in such a way that motor housing is kept full at all times. If necessary, the drain line is to be looped above the motor.

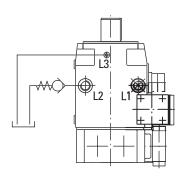

Shaft Down

Use venting port Lx (provided only on request). Pre-load drain port L1 with 0,2 bar (3psi).

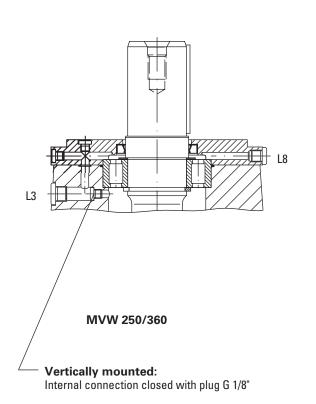

Shaft Up

Use venting port L3. Pre-load drain port L1 with 0,2 bar (3psi).

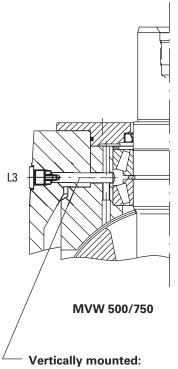

Note: Drain piping shown, with respect to installation positions, is required for proper bearing lubrication. Also see case flushing information on next page.

Installation Data (cont.)

Horizontally mounted:

Internal connection open L3 plugged

Vertically mounted: Internal connection closed with pin no. HC406082101401

Horizontally mounted:

Internal connection open L3 plugged

Application Data Fluid Recommendations

Case Flushing Requirements

A check valve must not be used in the drain pipe. The drain pipe must interminate below the oil level in the reservoir.

For all other conditions with low pressure <20 bar (<300psi) and low flow (<10% of Qmax) case flushing is required.

For operation with special fluids HFB and HFC, case flushing is recommended.

Flushing Flow

Flushing flow via the pump case should be >1% of maximum pump flow. Maximum flushing flow depends on case pressure.

Notes:

- All listed ratings are based on the use of a good quality fluid.
- Alternative fluids have a reduced tolerance for contamination over petroleum base fluids. Good filtration is, therefore, critical.

 The motors will provide exceptional life when used with a good quality clean fluid at the pump ratings specified for that fluid.

Fluids

Motors in this catalog are primarily designed to operate with conventional petroleum-based hydraulic oil. Alternative fluids and restrictions:

 Fluid maintenance is critical to the durability of all hydraulic components, and particularly so with hydraulic motors. This becomes even more of a factor when alternative fluids are used. All types of alternative fluids require extensive maintenance in order to maintain proper levels of water content, acidity, viscosity and contamination.

Fluid Cleanliness

These motors are rated for anti-wear petroleum fluids with a contamination level of 18/15/13 per ISO 4406. Operation in fluids with higher contaminal levels than this is not recommended and may reduce the life of the pump components. Fluids other than petroleum, severe service cycles, or temperature extremes are cause for adjustment of these codes. Please contact your Eaton representative for special duty cycle recommendations.

Eaton motors, as well as any variable displacement piston motors, will operate with apparent satisfaction in fluids up to the rating specified here. Experience has shown, however, that pump and hydraulic systems lives are not optimized with high fluid contamination levels (high ISO cleanliness codes).

Proper fluid condition is essential for long and satisfactory life of hydraulic components and systems. Hydraulic fluid must have the correct balance of cleanliness, materials, and additives

for protection against wear of inclusion of air.

Essential information on the correct methods for treating hydraulic fluid is included in Eaton publication 561- "Vickers Guide to Systemic Contamination Control"- available from your local Eaton distributor. In this publication, filtration and cleanliness levels for extending the life of axial piston pumps and other system components are listed. Included is an excellent discussion of the selection of products needed to control fluid condition.

Ordering Procedure

When ordering, please specify full model designation of items required, see "Model Codes" section of this catalog.

Note The Following:

 Designation of variable displacement pumps must include the supplementary designation of the required control type.

FLUIDS

		MAX.	MAX.	RECOMMENDED	MAX.		
TYPE	CLASSIFICATION	PRESSURE BAR	SPEED RPM	SEAL MATERIAL	OPERATING TEMPERATURE °C	BEARING LIFE	
Oil in Water Emulsion	HFAE	Not Rated				0%	
Water in Oil Emulsion	HFB	250	1800	Fluorocarbon	49	50%	
Water Glycol	HFC	250	1800	Fluorocarbon	49	25%	
Phosphate Ester	HFDR	350/420	1800	Fluorocarbon	66	100%	
Polyol Ester	HFDU	350/420	1800	Fluorocarbon	66	100%	

^{*}Refer to the general specifications for the displacement speed limitation
